

CLAIMS

1. A method for providing an accurate service record from a second communication device to at least one first communication device, the method comprising the steps of:

5 first determining whether a modem is present in the second communication device;

second determining whether a proper phone line connection exists in the second communication device; and

generating, by the second communication device, a service record identifying
10 modem-based services that can be offered by the second communication device to the first communication device, based on the results of the first and second determining steps.

2. The method of claim 1, further comprising:

communicating the service record from the second communication device to
15 the first communication device using short-range wireless communication techniques.

3. The method of claim 2, wherein the communicating step is implemented by Service Discovery Protocol installed in the first and second communication devices.

4. The method of claim 2, wherein the short-range wireless communication techniques include Bluetooth communication techniques.
5. The method of claim 1, wherein the second determining step includes:
detecting whether a phone line is plugged into a phone jack connected to the
5 modem of the second communication device.
6. The method of claim 1, wherein the second determining step includes:
determining a voltage difference between wires of a phone line connected to
the modem of the second communication device.
7. The method of claim 1, wherein, in the generating step, the service record
10 identifying the modem-based services is generated if the first determining step
determines that the modem is present in the second communication device, and if
the second determining step determines that a proper phone line connection exists
in the second communication device.
8. The method of claim 7, wherein, once the service record is generated, the
15 first and second determining steps are repeated, and if the second determining step
determines that a proper phone line connection does not exist currently in the
second communication device, then the method further comprises:

removing a portion of the service record that identifies the modem-based service.

9. The method of claim 1, further comprising:

generating a message informing the first communication device that there is
5 no proper phone line connection when the second determining step determines that
no proper phone line connection exists in the second communication device.

10. The method of claim 1, wherein the modem-based services include at least
one of the following: a Dial-up Networking Gateway service and a fax service.

11. A method of providing an accurate service record identifying services that
10 can be offered by a communication device, the method comprising the steps of:

determining whether a proper line connection for providing services exists for
the communication device; and

generating a service record identifying the services if the determining step
determines that a proper line connection exists.

12. The method of claim 11, further comprising:

15 once the service record is generated, removing the services from the service
record if the determining step currently determines that no proper line connection
exists for the communication device.

13. The method of claim 11, wherein the services are modem-based services and the line connection is a phone line connection to a modem in the communication device.

14. The method of claim 13, further comprising:

5 determining whether the modem exists in the communication device; and
generating the service record if the modem exists in the communication device and the proper line connection exists for the communication device.

15. The method of claim 11, wherein the services include a LAN access service.

16. A communication device for providing an accurate service record identifying services that can be offered by the communication device, the communication
0 device comprising:

a line detector for determining whether a proper line connection for providing services exists for the communication device; and

communication means, coupled to the line detector, for generating a service
15 record identifying the services if the line detector indicates that a proper line connection exists.

17. The communication device of claim 16, wherein, once the service record is generated, the communication means removes the services from the service record

if the line detector currently indicates that no proper line connection exists for the communication device.

18. The communication device of claim 16, wherein the services are modem-based services and the line detector is a phone line detector.

19. The communication device of claim 18, wherein the communication means determines whether a modem exists in the communication device, and generates the service record if the modem exists in the communication device and the phone line detector determines that a proper phone line connection exists for the communication device.

20. The communication device of claim 16, wherein the services include a LAN access service.

21. The communication device of claim 16, wherein the communication means includes a Bluetooth device.

22. A second communication device for providing an accurate service record to a first communication device, the second communication device comprising:
a modem;

a Bluetooth device, coupled to the modem, for determining whether the modem is present in the second communication device; and

a phone line detector, coupled to the Bluetooth device, for determining whether a proper phone line connection exists in the second communication device,

5 wherein the Bluetooth device generates a service record identifying modem-based services that can be offered by the second communication device to the first communication device, if the modem is present in the second communication device and the proper phone line connection exists in the second communication device.

23. The second communication device of claim 22, wherein the Bluetooth device is installed with a Service Discovery Protocol.

24. The second communication device of claim 22, the phone line detector detects whether a phone line is plugged into a phone jack connected to the modem of the second communication device.

25. The second communication device of claim 22, wherein the phone line
15 detector detects a voltage difference between wires of a phone line connected to the modem of the second communication device.

26. The second communication device of claim 22, wherein, once the service record is generated, the Bluetooth device removes a portion of the service record

that identifies the modem-based services from the second communication device if the Bluetooth device determines that there is no proper phone line connection currently in the second communication device.

27. The second communication device of claim 22, wherein the Bluetooth device
5 generates a message informing the first communication device that there is no proper phone line connection when the Bluetooth device determines that no proper phone line connection exists in the second communication device.

28. The second communication device of claim 22, wherein the modem-based services include at least one of the following: a Dial-up Networking Gateway service, and a fax service.

29. A computer program product embodied on computer readable media readable by a communication device, for providing an accurate service record by the communication device, the computer program product comprising computer executable instructions for:

15 determining whether a proper line connection for providing services exists for the communication device; and

generating a service record identifying the services if it is determined that the proper line connection exists.

30. The computer program product of claim 29, further comprising computer executable instructions for:

once the service record is generated, removing the services from the service record if it is determined that no proper line connection exists for the communication device.

31. The computer program product of claim 29, wherein the services are modem-based services and the line connection is a phone line connection to a modem in the communication device.

32. The computer program product of claim 31, further comprising computer executable instructions for:

determining whether the modem exists in the communication device; and
generating the service record if the modem and the proper phone line connection exist in the communication device.

33. The computer program product of claim 29, wherein the services include a LAN access service.
